

"Your course is simply the best CME course out there. When it comes to intubation, learning how to do it right sure beats trying to figure it out on my own over and over again. Your course gave me the knowledge and confidence I need in dealing with difficult airways."

"This will change every intubation I do, supervise, or teach for the rest of my career."

"The ability to see human anatomy is completely invaluable to the learning experience. Great faculty."

"I attended the airway course in February and wanted to tell you what a great experience I thought it was. It definitely helped to boost my level of confidence and comfort when dealing with difficult airways. I have encouraged all members of my group to attend the conference."

"It was about 1 am on a busy Friday night, about a week after I took your course. The ED was packed- when I was paged to the ICU to intubate an EXTREMELY belligerent 270 pound 36 year old male- with a short bull neck and no chin - who was s/p craniotomy for resection of a brain tumor and needed to be taken down to manage his likely rising ICP. I was the only doc in the hospital. There was no backup. And the intubation went so smoothly thanks to what you taught me that the next few times I saw those ICU nurses, they told me they were always relieved when they knew I was the one in house. Thanks for the new skills and for helping to build my confidence."

"I enjoyed the course enormously. To think that after 7 years of residency (4 surgery and 3 ER) and 6 years as an attending...To come across something that changes my practice in a very basic way is amazing. I truly believe that the airway course should be a required part of all residency training. Since the course I have had 3 difficult intubations in heavy patients with short stature and initial epiglottis only views. Using a combination of optimal ear to sternal notch positioning and ELM they have all gone smoothly on single attempts...As the managing partner I am having the practice send all new hires to the course and look forward to personally taking it again just to stay solid and fresh."

"After your course that I attended in Baltimore, I was so impressed that I purchased the set of 3 videos, and they now will be a core teaching tool in all of our resident anesthesia rotations (PG1 general anesthesia rotation, PG2 trauma anesthesia, and PG3 pediatric anesthesia). In addition, I very strongly recommended to all of our faculty and soon-to-be graduates that they too should take your course. After having taken (and even taught in) some of the other airway courses out there, I can honestly say that yours is the best!"

"The best EM / CME course I've ever had in 15 years. The ability in this to formally learn directed laryngoscopy course in a realistic way is unique for EM physicians and far surpasses standard mannequin teaching."

"Thank you very much for a great course. I learned more in two days with you than during a residency. I'm not exaggerating. I hope your residents auditing the course learned as much as we did. I would have loved to have had this experience at their time in training."

"Thank you for such a great airway management course. Few CME courses have ever changed my practice of medicine. Yours is an exception as I will indefinitely incorporate the techniques I have learned from you in my management of patients' airways. I will recommend your course to my colleagues unconditionally."

"The cadavers offer a great opportunity to visualize and explore the laryngeal inlet. Thank you very much. Great course!"

"The airway course was very informative and in tune with what is important in managing the ER airway. I would definitely recommend it to others. Since returning to work I have had two potentially difficult airways (each about 300 lbs and one with an INR of 9) and using the skills I learned from your class I was able to intubate without difficulty."
